

MEDIADISK 2006 OR COMMSOURCE

FAQ – Configuring Watchguard firewall for Mediadisk 2006 or
CommSource

July 2007

CISION 

When configuring a Watchguard firewall for use with Mediadisk 2006 or CommSource, even though rules may be present to allow all HTTP traffic through port 80, you may need to create a new rule for the following IP addresses:

- a) 213.52.222.167, 213.52.222.168 and 213.52.222.175 for Mediadisk 2006 or CommSource
- b) 62.231.148.21 for distribution within Mediadisk 2006 or CommSource

If the addresses listed in a have not been allowed access, the application will not work and no statistics will be displayed in the login window.

If the addresses in b. have not been allowed access, distributions will not be dispatched (i.e. a message will be displayed to inform you that your distribution has been sent, but you will not receive a confirmation number, and the distribution will not have been sent).

Please ensure that you create separate rules for http traffic to the above-mentioned addresses where applicable.
